PATIENT TRACKING & SCHEDULING SYSTEM

By: Andrew Patton

PROBLEM

Many healthcare facilities still rely on outdated systems or manual processes to track patients and manage scheduling.

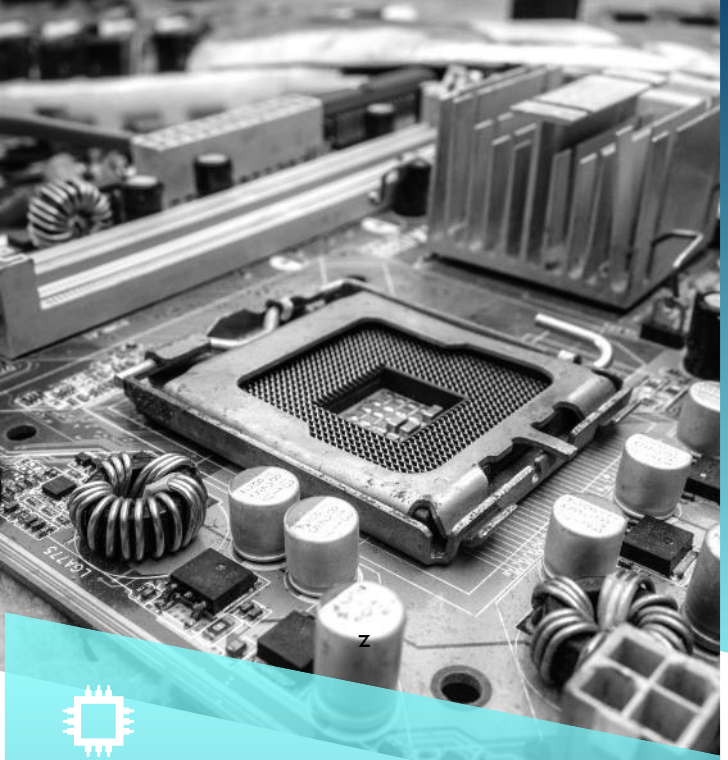
This can lead to delays in patient care, scheduling conflicts, and poor communication between departments.

Without real-time visibility, staff may struggle to coordinate patient movement efficiently.

SYSTEM FEATURES

Add & manage patient information
View current patient list
Schedule patient appointments
View scheduled appointments
Simple and easy to use interface
Data stored using browser local storage

https://github.com/aspatton571/INFO-C-451-Final-Project



BENEFITS

- Improves workflow
- Reduces Scheduling errors
- Provides better visibility of patients
- Supports coordination between staff
- Easy for the staff to learn and use

HOW IT WORKS

The system runs in a web browser and allows users to enter patient data and schedule appointments.

All data is stored locally using browser storage, so information remains available even after refreshing the page.

Users can quickly view and manage patients and appointments in one place.

System Requirements:

- Web browser (Chrome, Edge, Firefox)
- Internet access
- No installation required

FUTURE IMPROVEMENTS

- Integration with hospital systems (EHR)
- Secure database storage
- Multi-user access
- Role-based permissions
- Real-time updates across departments

This prototype demonstrates the foundation for a more advanced healthcare system.
